GENERAL DESCRIPTION

The LND20/Series gas, oil, and combination gas/oil burner is a forced draft packaged burner system. A backward curved aluminum impeller mounted in a machined housing provides combustion air for various furnace pressures or high altitude applications. The air housing is hinged for convenient inspection or service of the firing head components.

Oil firing features a low pressure air atomizing design. A positive displacement oil metering unit, rotary vane air compressor, and air atomizing nozzle are integral parts of this system. The positive displacement oil metering unit is not affected by changes in oil temperature or viscosity.

The LND20 feature a dual gas manifold construction to control inner and outer gas spuds independently for better flame density and shape. Each zone is controlled by a butterfly control valve and 14 point UL listed cam. Gas ports located behind the diffuser provide a pre-mix zone with combustion air and F.G.R. Gas ports located ahead of the diffuser provide efficient mixing for flame retention.

Flue gas recirculation (FGR) is drawn through the burner blower assembly properly sized for the required NO_x emission levels. An FGR control valve is positioned by the FGR system to provide FGR at all firing rates. An FGR shutoff valve is placed in the FGR line as part of a safety system. This shut-off valve prevents combustible gases from being drawn into the boiler furnace prior to pilot and main flame ignition. Proper operation of this system is proven by three (3) electrical safety interlocks. The system is equipped with ANSI flanges to allow easy installation into the FGR piping.

The LND20 Series is guaranteed to provide less than 20 ppm NO_x, corrected at 3% O₂ dry, and less than 50 ppm CO, throughout the firing range when firing natural gas.

Listed by Underwriters Laboratory. CSD-1, I.R.I., F.M., C.S.A. and other regulatory agency control options are available. Every burner is assembled, wired, and tested at the factory.
